With Assureon NX, organizations can now benefit from our award-winning Assureon technology in a compact and easy-to-implement rackable appliance.

Designed to provide exceptional archiving and retrieval capabilities for smaller enterprises, branch offices and departmental groups, Assureon NX delivers smart, fast, and affordable online access to all your fixed content information—enabling you to simplify and automate your archival processes including e-mail, electronic discovery, medical records and imaging, and streamline backup and recovery.

POWERFUL CAS TECHNOLOGY

Assureon NX uses the power of CAS (Content Addressable Storage) to simplify management and reduce the cost of storing important digital assets. CAS technology produces a unique file identifier for all objects, based on their content. Assureon's 2nd generation CAS model stores files, images, recordings, etc, as objects with a secure and unique universal identifier. This approach differs from traditional file system models, where an application or user names the file and then places it in a hierarchical file system. Assureon's CAS technology frees users from the significant lack of scalability and high management costs of traditional file system models.
